Study of 29 cases]. The arterial switch operation was performed on 29 patients with the total transposition of the great arteries (TGA). The patients were between three months and six years old (mean age 3 years). There were 21 boys and 8 girls. Twenty-five patients underwent the arterial switch operation and four the Mustard's operation. The internal mammary artery was interposed in all but three cases. Eighteen patients had a ventricular septal defect and four had a patent ductus arteriosus. One patient had both defects. There was no operative death. Four early deaths occurred. The hospital mortality was 14.5%. Seven patients (24%) developed left or right ventricular failure, requiring surgical repair. Two patients with left ventricular failure were reoperated, with the right ventricular outflow tract (RVOT) being closed in one patient and the pulmonary artery being reconstructed in the other. One late death occurred 17 months after the operation, due to congestive heart failure. The hospital mortality and morbidity were 20.6% and 22.2%, respectively. In the 29 patients who survived, one reoperation was required for severe residual ventricular dysfunction (RVED) and another for an abnormal electrocardi a1d647c40b
