Smith is not your typical astronomer. He was born in Hempstead, Texas, the son of a jazz guitar instructor who would take the young Larry along on trips to New Orleans. When he turned 12, Smith was enrolled in the Littleton public school system. He was a good student. But "never anything outstanding," he said. He attended Westfield College in Massachusetts on a baseball scholarship and graduated with a B.A. in economics. At 20, Smith was in graduate school at the University of Pittsburgh, working on his Ph.D. in economics. His research concerned computer science, artificial intelligence and mathematical modeling. Smith had been involved in a string of research projects. Some of them were funded by the National Science Foundation, and others by the Defense Department and the National Oceanic and Atmospheric Administration (NOAA). But he had never had any research grants to his name. So he approached a professor from Carnegie-Mellon University, David Goldberg. "He'd been studying the economic world for a while," Smith told me. "I think one of the first things he did was to go visit Larry Smith on the east coast. He said, 'You've got to give me five years of your research.' " Smith gave Goldberg his list of publications. From it, Goldberg derived a number of tools for analyzing economic trends and patterns. He suggested that Smith could use those tools to develop quantitative models and develop a program to make them more mathematically elegant, more precise and more robust. With that advice, Smith founded Binary Analysis (1975-1981), a now celebrated early attempt to make complexity science, and in particular artificial intelligence, accessible for a broader set of researchers. Binary Analysis produced a series of widely read books, beginning with *The Logic of Economic Analysis*. As the series continued, Smith expanded his coverage of computers beyond

machine models to include the course of human history. He taught subjects on history, mathematics and economics. He traveled widely, including to India, to give talks on Binary Analysis. Bookstore readers from all walks of life learned to think about thinking as the task of computing. Smith even taught some homework. "He used to send a questionnaire to his groups," Smith said. "'Who here has read of the possibility of a universal computer?'" to which the students
